Standard proctor test report

Standard proctor test		Modified proctor test	
Dry density (kg/m ³)	Water content (%)	Dry density (kg/m ³)	Water content (%)
1691	9.3	1873	9.3
1715	11.8	1910	12.8
1755	14.3	1803	15.5
1747	17.6	1699	18.7
1685	20.8	1641	21.1
1619	23		

The results of a standard Proctor test are given in the following table. Determine the maximum dry density (kg/m³) of compaction and the optimum moisture content.

Volume of Proctor mold (cm ³)	Mass of wet in the mold (kg)	Moisture content (%)
943.3	1.68	9.9
943.3	1.71	10.6
943.3	1.77	12.1
943.3	1.83	13.8
943.3	1.86	15.1
943.3	1.88	17.4
943.3	1.87	19.4
943.3	1.85	21.2

What paper does moisture play? 7. The measured densities at the place of the compacted filling are compared with the results of the proctor test to determine the ground floor grade are the most basic and least expensive construction materials available. The results are plotted with moisture on the horizontal axis and dry unit weight on the vertical to form a curve that defines maximum dry density and optimum moisture content.NOTE: There are variations of test procedures noted in both the standard and modified test methods that are dictated by the maximum particle sizes of the soil samples. For all human history, construction projects from primitive burial mounds to modern interstate highways have removed, replaced, filled, or shaped the soil surface to accommodate pavements and structures, or to make the earthwork itself a structure. In simple terms, densities were too low, and optimum moistures were too high for these increased loadings. A sample of the specimen is obtained to determine the exact moisture content by oven drying, and the process is repeated for subsequent samples.The moist density, of each compacted specimen is computed by dividing the mass of the soil (minus the mold assembly) by the volume of the mold. That concept is known today as the moisture-density relationship test, laboratory compaction characteristics of soils, or simply the standard Proctor test, and is detailed in ASTM D698 and AASHTO T 99 test methods. During compaction, the soil particles are relocated, and the air volume is reduced. Coarser materials are set aside for particle size determinations and in some cases for adding proportionally back into the final test specimens. Dry density of the soil. The selection of the method is based on project requirements and specifications. In the field, sheep foot rollers, rubber-tired rollers and other type of heavy compaction equipment including hand tamper may be used. Proctor in 1933, in his honor; the standard laboratory compaction test which is developed is commonly called the Standard Proctor Test. Standard: 1. The modified Proctor method uses a 10lb With a falling height of 457 mm (18 ") to compact. The reader is encouraged to read and carefully understand the ASTM or ASHTO test method. Proctor compact test: Compact test equipment required to perform The laboratory probe test is also simple and widely available. Yes, Å Ç oThe gym is ultimately, you may want to call a favor or two, or better, consider a mechanical soil compactor.
